Personal note on

Introduction of Complexity

—

By Rifah Sajida Deya

Introduction

In computer science, **complexity** refers to the measure of the resources required for an algorithm to solve a problem. Typically the resources are: Time Complexity and Space Complexity. Let's know about their definitions:

1. Time Complexity:

   The amount of time an algorithm/program takes to complete to execute, can be defined as time complexity. It is often expressed using Big-O notation, which provides an upper bound on the runtime (e.g.,$O(n)$, $O(n^2)$, $O(logn)$).

2. Space Complexity:

   The amount of memory space an algorithm/program takes to complete to execute, can be defined as time complexity. It is also expressed using Big-O notation.

Why Complexity Analysis?

- Compare different algorithms to choose the most efficient one.
- Optimize programs to handle larger dataset and run faster.
- Identify potential performance bottlenecks of a system/program.
